

## AMENDMENTS TO THE CLAIMS

Please accept amended Claims 2 and 3 as follows.

Listing of claims:

1. (Previously Presented) A computer readable medium embodying instructions executable by a processor to perform method of generating a feasible schedule for  $n$  jobs given a duration and a revisit time for each job, comprising:

receiving a input data describing the  $n$  jobs, the duration, and the revisit time for each of the  $n$  jobs;

determining from the input data whether a round robin schedule is possible and upon determining that the round robin schedule is not possible performing steps for determining a feasible schedule, wherein determining the feasible schedule comprises,

calculating a theoretical probability for each of the  $n$  jobs, wherein the theoretical probability is a probability that a job will be performed next;

calculating an actual probability for each of the  $n$  jobs, wherein the actual probability is a relative amount of time that each job is to be performed;

creating a potential schedule for the  $n$  jobs based on the theoretical probabilities and the actual probabilities;

searching for the feasible schedule of the  $n$  jobs from the potential schedule of the  $n$  jobs; and

outputting the feasible schedule wherein the  $n$  jobs are scheduled according to the feasible schedule.

2. (Currently Amended) The computer readable medium of claim 1, ~~wherein~~ further comprising

determining whether it is impossible to generate a feasible schedule comprises by determining

$$\sum_{i=1}^n \frac{\tau_i}{\tau_i + \mu_i} > 1$$

whether is satisfied, wherein

$n$  is a number of jobs,

$\tau_i$  is a duration time, and

$\mu_i$  is a revisit time.

3. (Currently Amended) The computer readable medium of claim 1, wherein determining

wherein determining whether a round robin schedule is possible comprises determining whether

$$\sum_{i \neq l}^n \tau_i \leq u_i$$

is satisfied, wherein

$n$  is a number of jobs,

$\tau_i$  is a duration time, and

$u_i$  is a value of a residual vector.

4. (Previously Presented) The computer readable medium of claim 1, wherein calculating

theoretical probabilities comprises selecting a theoretical probability

$$z_i \geq \frac{\tau_i}{\tau_i + k \cdot u_i}, i = 1, \dots, n, \text{ such that } \sum_{i=1}^n \frac{\tau_i}{\tau_i + \mu_i} = 1, \text{ wherein}$$

$\tau_i$  is a duration time,

$u_i$  is a value of a residual vector,

$n$  is a number of jobs, and

$\mu_i$  is a revisit time.

5. (Canceled)

6. (Previously Presented) The computer readable medium of claim 4, wherein calculating theoretical probabilities further comprises calculating an array including the theoretical probability for the  $n$  jobs.

7. (Canceled)

8. (Previously Presented) The computer readable medium of claim 1, wherein creating a potential schedule based on the theoretical probabilities and the actual probabilities comprises determining a difference between the theoretical probabilities and the actual probabilities for each of the  $n$  jobs.

9-10. (Canceled)

11. (Previously Presented) The computer readable medium of claim 1, wherein the method further includes outputting the round robin schedule for the  $n$  jobs upon determining that the round robin schedule is possible.

12. (Previously Presented) The computer readable medium of claim 8, wherein searching for the feasible schedule of the  $n$  jobs from the potential schedule of the  $n$  jobs further includes determining a job number for each of the  $n$  jobs.
